

PIN Services Network Diagram Showing How Virtual Private Network (VPN) Works

OpenVPN allows a direct and secure network connection to be made between the laptop and the office. Access is identical to when the laptop is connected at the office.

Solid Lines show cable connections, dotted lines are wireless connections.

Routes with red exclamation marks are insecure. Routes with locks are secure.

NOTE: These are not separate wires, just different ways of sending data – one is encrypted, the other is not. Red dotted lines show what shared folders mapped drives connect to, not physical connections
